
Deterministic level: seed 1, no random perturbation. The replication takes lulcc's training cells (and, to test the allocation alone, its probabilities and demand); maps compared cell by cell.
Audit: the CLUE-S that runs is DisSLUCC's; five negative controls (elasticity, scale factor, tolerance, suitability, demand) make the maps differ.

Ensemble level: the published script, 30 seeds in each implementation, independent random numbers; 20 metrics (AUC of the regressions; figure of merit at 8 resolutions, CLUE-S and ordered).
Criteria fixed before the runs: means within 3 standard errors and KS p ≥ 0.01. **20 of 20 pass.**
